

Nucleic Acid Binding Proteins (Romanesco/ChrocodiLE)

KEY INVENTION

- ◎ Romanesco is induced to the target promoter to visualize the dynamics of mRNA in living cells.
- ◎ ChrocodiLE sequence-independently binds to DNA in the open state to track the change of the genome 3D Structure over time in living cells.

**The dynamics of nucleic acids (DNA and mRNA)
can be visualized in living cells.**

SUMMARY of INVENTION

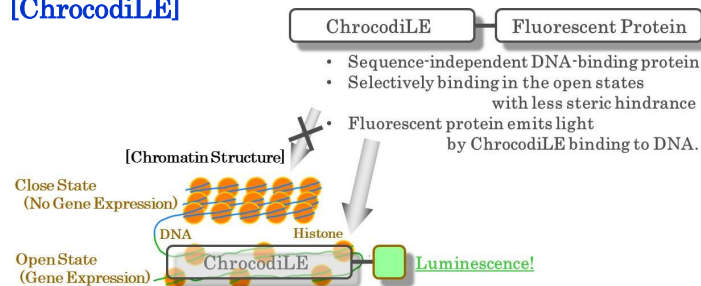

[Romanesco]

(Imaging of Transcriptional Dynamics in Cells)

[ChrocodiLE]

(An Observation of Knock-in Mouse Tissues)

COMPARISON with and ADVANTAGE over CURRENT TECHNOLOGIES

[Romanesco]

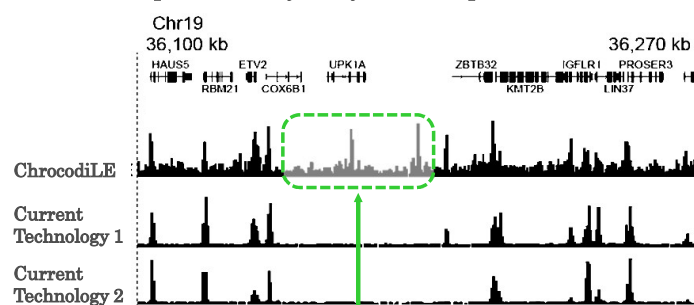

Fluorescence intensity is 300 times higher than Broccoli, and transcriptional activity can be analyzed by simultaneous measurement of protein and mRNA.

[ChrocodiLE]

The sequences in the open state regions that could not be observed by current techniques can be observed.

[Genome Sequence Analysis by DNA Sequencer]

The sequences in the open state regions that could not be observed by current techniques

APPLICATION expected

- ◎ Probes for tracking the internal behavior of drug-responsive genes (drug-metabolizing enzymes, etc.)
- ◎ Analysis of genes expressed in living cells during neuronal differentiation and neuronal repair in specific neural tissues
- ◎ Imaging of genes expressed in specific diseases (cancer, diabetes, Alzheimer's disease, etc.) in live cells
