Summary :

In the near future, autonomous cars can not only carry people and parcels, but also can monitor roads, utility poles, etc. at the same time. In this project, we develop an autonomous car service platform named "Synergic Mobility" which is utilized by various service companies through APIs. By using the platform, we can perform simultaneous real-world data collection, mobile services, pick-up and delivery services, etc. on the same autonomous car. We will realize a paradigm shift from sharing economy to synergic economy.
