

Sustainable and resilient social system for healthy nature

R&D Project Title : Environmental and social impact assessment to realize nature positive through the industry-government-community partnership

Project Leader : MANAGI Shunsuke
Distinguished Professor, Urban Institute, Kyushu University

R&D Team : Kyushu University, Tokyo City University, Kyoto University, Kobe University

Summary :

The depletion of natural resources is one of the most significant issues in the global community today. Therefore, this project aims to achieve a rebound in net natural capital to realize *nature positivity*.

- Academic research on the impact of human activities on natural capital has been insufficient.
- This project will develop a new method to quantify natural capital from both flow and stock perspectives by integrating the Inclusive Wealth Index and life cycle assessment.
- This method will enable companies and local governments to implement a PDCA cycle for natural capital.
- For effective development and demonstration, a consortium will be formed to deepen the research and implement it in society.
- This project is expected to have the impact of making it universally clear that the realization of nature positivity is the desirable choice.
