Working Group 2

Realizing a human life that "continues to improve both physically and psychologically" through complete understanding of biological functions such as the nervous system and related tissues

Chair: Prof. Gen Sobue, Sub-Chair: Prof. Shigeo Okabe

[The Moonshot [Area], [Vision] for setting MS [Goal] candidate]

[Area]
2 Areas

- Leveraging the Aging Society.
 Turning the aging society into the innovative and sustainable society by harnessing diversity through techno-social transformation
 - Exploring frontiers with science and technology

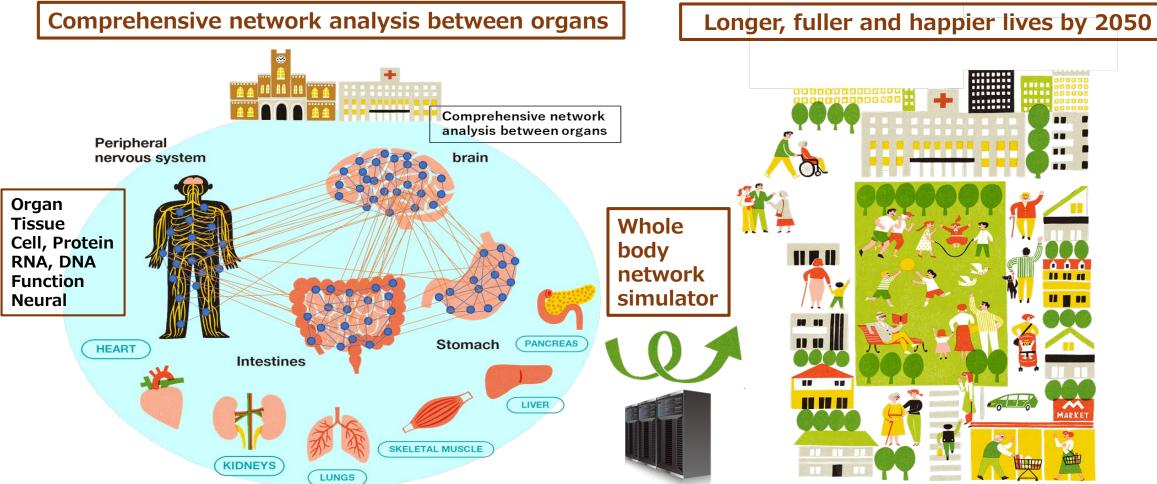

[Vision] 3 Visions

- Society without health anxiety: everyone can enjoy life until 100 years old (achievement of well-aging)
- Reproducing and controlling key biological processes (biotech)
- In-depth understanding of neural and associated systems (brain/nerve system)

MS Goal Candidate

By 2050, realization of ultra-early disease prediction and intervention based on the Whole Body Network Atlas for longer, fuller and happier lives

Whole-body Network Simulator

Target long-term target

- By 2050, we establish a system for disease prediction and evaluation of the pre-symptomatic states.

 This will be achieved by integrated analysis of the entire functional network between human organs and will ultimately realize the suppression and prevention of disease.
- By 2050, we establish a strategy that enables the conversion of a pre-symptomatic state to a healthy state.
 Functional changes in human physiology along life course will be clarified from the viewpoint of a comprehensive network between organs.
- By 2050, we identify disease-related network structure, including molecular targets as its component, and establish innovative prevention, diagnosis, and treatment methods.
- We establish non-invasive techniques applicable to human subjects for observing and manipulating organ networks, etc.

Strategy of the process for R&D projects

Understanding on comprehensive network between human organs

Biological approach

Mathematical approach

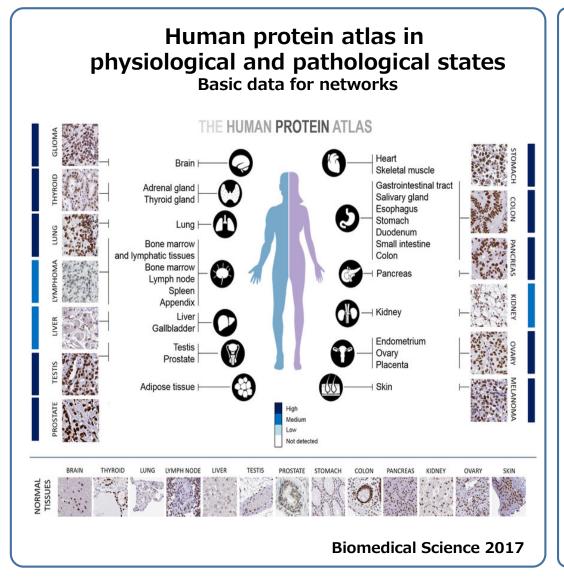

Molecular cytological approach and Biochemical approach

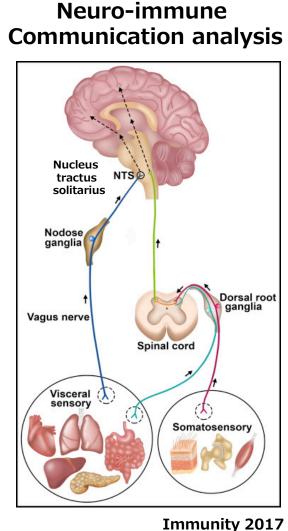

Biological approach: High-resolution in vivo imaging, Human cell atlas, Human protein atlas, Gut-brain communication analysis, Metabolic information highway analysis, etc **Mathematical modeling approach**

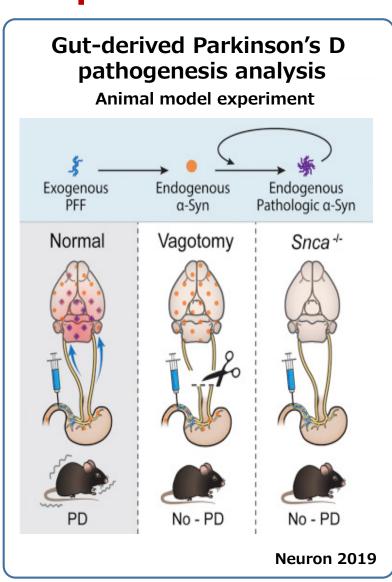

Mathematical modeling approach: Dynamical network biomarker analysis, Trans-omics analysis, Structural sensitivity analysis, Structural bifurcation analysis, etc

To develop the technology for network analysis is highly expected particularly in collaboration with company

Examples of biological approaches are presented

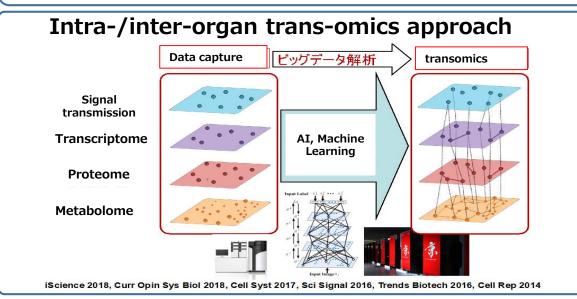

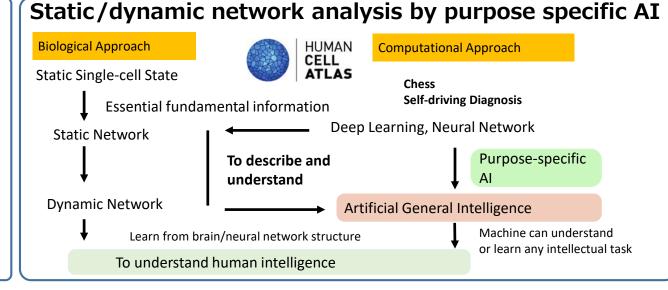

Examples of mathematical modeling approaches are presented

Multimodel analysis Anat./Phys. Data Multiscale Models Discovery/Impact structural MRI **Functional Models** diffusion MRI Behavior/Cognition Principle of computation resting/task fMRI Prediction of failures Rate Coding Models NIRS/EEG/MEG Representation/Algorithm **ECoG** Scalable algorithms constraint. prior Diagnosis/prognosis transparent brai Spiking Models neural tracers Dynamic computation LFP Flexibility/robustness electrode arrays Low-energy computation Ca²⁺ imaging **Biophysical Models** Physical computing Cellular mechanisms molecular imaging Genetic mechanisms serial section EM Therapeutic targets

Dynamical Network Biomarker (DNB) (The Leading Network) States Network Reversible Pre-disease State Disease state

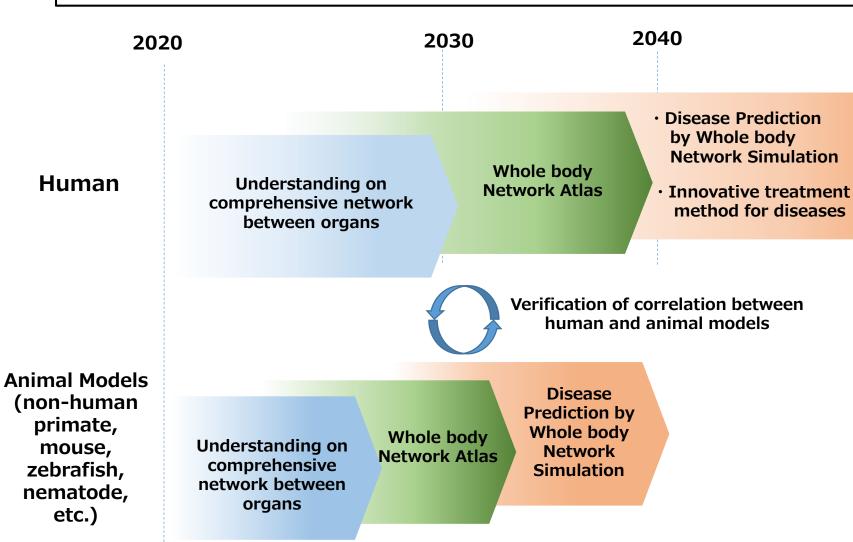

The Milestone of Innovative Approaches for Ultraearly prediction and prevention for healthy society

Moonshot International Symposium

Ultra-early disease prediction and intervention based on "Whole-body Network Atlas" for a longer, fuller and happier life.

2050

Working Group 2 Conclusion

MS Goal candidate

By 2050, realization of ultra-early disease prediction and intervention

based on the Whole Body Network Atlas for longer, fuller and happier lives
