Issues of Energy and Environmet in 21st Century and Functional Carbon Materials to Solve the Issues

Isao Mochida

Research and Education Center of Carbon Resource, Kyushu University 6-1 Kasugakoen, Kasuga, Fukuoka, 816-8580 Japan mochida@cm.kyushu-u.ac.jp

We meet three issues of energy and environment in 21st century.

- 1. Huge increase of energy demand due to marked increase of pollution in developed and emerging countries
- 2. Limited supply of fossil energy, limits of nuclear energy use, and low efficiency and high cost of renewable energy, but the inevitable transition to it
- 3. CO_2 and other environmental issues in relation to energy consumption.

We need numbers of breakthrough in the technology for energy, materials and environment.

- 1. Higher efficiency in production, transformation and use of available energy sources
- 2. Increasing supply of energy sources
- 3. Reduction of CO_2 emission not to increase its concentration in the atmosphere while fossil resources are available

The transient in the primary and secondary energy as summarized in Figure 1 must be recognized definitely. The technology and responding society can define the transients. Japanese government set up 21 technologies in Figure 2 to be prioritized. They cover almost all technologies to be developed in this century if we are allowed to expand a little their scopes.

In my talk, I try to emphasize the importance of carbon materials and fossil resources as the feed for energy and carbon materials. The preparation and modification / functionalization of carbon materials are summarized in Figure 3. I picked up several examples in traditional and novel carbon materials to review their importance.

Petroleum and Its Derived or Related Liquid Fuels Can Be Last Forever.
