# SIP Energy Carriers

Reducing CO<sub>2</sub> emission is a global issue. For Japan, a country poor in energy resources, it is necessary to construct a low-carbon society as well as to promote a stable energy supply through the diversification. We have large expectations for the role of hydrogen energy. However, towards the large-scale use of hydrogen, there remains a lot of issues to overcome technology barriers and high cost. Proceeding the research, development and demonstration of hydrogen technologies with industry-academia-government collaboration under the leadership of government will contribute significantly to solve energy and environment problems in Japan. And it will eventually bring Japan a world leader in hydrogen utilization and the related industries.

Under these circumstances, "Energy carriers", a technology development program toward the realization of hydrogen society has been launched as one of the 10 themes of the Cross-ministerial Strategic Innovation Promotion Program (SIP) spearheaded by the Council for Science, Technology and Innovation in 2014. "Energy carriers" is the method to efficiently store and transport hydrogen as liquid, while hydrogen, gaseous at normal state, is difficult to handle.

In this program, we aim to build CO<sub>2</sub>-free hydrogen value chain by focusing on the developments of technologies for CO<sub>2</sub>-free hydrogen production, conversion to energy carriers; liquid hydrogen, organic hydride and ammonia, and storage, transportation and utilization.

## Strategy of Energy Carriers ~ Development of CO<sub>2</sub> free hydrogen value chain ~

- Hydrogen can be produced from various energy sources and can be utilized for electricity as well as fuel (Potential to reduce CO<sub>2</sub> emission significantly)
- Hydrogen has a difficulty in transportation, because it is low Btu gaseous form. It is essential to develop viable mass-transportation methods and related technologies (energy carrier) and make hydrogen to be affordable energy source.

## Vision

Realize the world's first new type low carbon society utilizing hydrogen in Japan by 2030 and be a role model in the world.

2015-2020

2020-2030

2030-

- Commercialization of fuel cell vehicle, residential fuel cell cogeneration

- Expansion of fuel cell markets
- Introduction of hydrogen power generation

- Commercialization of large scale hydrogen power plant
- Introduction of carbon free hydrogen in large scale

- Developments of technologies related to carbon free hydrogen production, energy carrier and utilizations of hydrogen and carriers
- Demonstration of hydrogen society in 2020 Tokyo Olympics and Paralympics

- Demonstration of high efficient power generation using hydrogen and energy carrier from small scale up to large scale

- Japanese hydrogen relevant industries play an active role in the global market

## Research & Development subjects

April 1, 2016

### Hydrogen-related research subjects

1 High-Temperature Solar Thermal Energy Supply

2 Hydrogen Production Technology Using Solar Heat

8 Development of Cargo Loading/unloading System for Liquid Hydrogen and the Relevant Rules for Operation

9 Development of Hydrogen Engine Technology

### Ammonia-related research subjects

Production

Carrier transformation  
Transportation  
Storage

Utilization

3 Development of Ammonia Synthesis Process from CO<sub>2</sub> Free Hydrogen

4 Basic Technology for Hydrogen Station Utilizing Ammonia

6 Ammonia Direct Combustion

5 Ammonia Fuel Cell

### Organic hydrides -related research subjects

7 Development of Hydrogen Supplying Technology Based on Organic Hydride

10 Safety Assessment of Energy Carrier

1

## High-Temperature Solar Thermal Energy Supply System

Research Director

Yukitaka Kato

Professor, Laboratory for Advanced Nuclear Energy, Tokyo Institute of Technology

**Purpose** Development of high-temperature (650°C) solar thermal energy supply system to produce H<sub>2</sub> efficiently by introduction of new solar thermal corrector, collecting tube, heat transfer media and thermal energy storage technologies

**Research Outline** The team is aiming that ammonia which has high volume hydrogen density is produced as an energy carrier by hydrogen produced from solar thermal energy supply system. High-temperature (650°C) solar thermal energy collection system with more than 70% of solar radiation and heat collection efficiency in which the temperature is higher than conventional solar thermal system is developed. Elemental technologies of solar corrector, heat transfer fluid, solar thermal energy collection tube, and thermal energy storage for 24 hour heat supply to H<sub>2</sub> production system are developed.

3

## Development of Ammonia Synthesis Process from CO<sub>2</sub>-Free Hydrogen

Research Director

Yasushi Fujimura

General Manager, R&amp;D Center, Technology Innovation Center, JGC Corporation

**Purpose** Development of high-efficiency ammonia synthesis process from CO<sub>2</sub>-free hydrogen produced from renewable energy or fossil fuel

**Research Outline** Major R&D Item is as follows:

◆ Development of ammonia

synthesis catalyst with high activity at low temperature

◆ The pilot plant will be constructed and operated in 2018 to confirm performance of the new catalyst and process.

2

## Hydrogen Production Technology Using Solar Heat

Research Director

Nariaki Sakaba

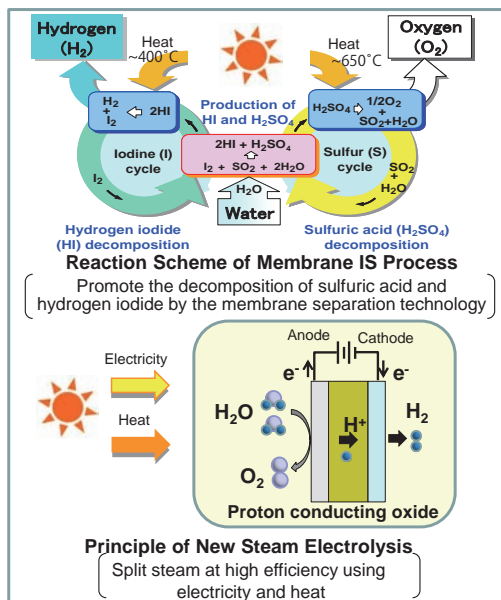

Group Leader, HTGR Hydrogen &amp; Heat Application Research Center, Japan Atomic Energy Agency

**Purpose** Development of highly efficient hydrogen production technologies by water splitting without CO<sub>2</sub> emission using solar heat at around 650°C

**Research Outline** Development of elemental technologies and demonstration of technical feasibility will be performed for the following two hydrogen production methods.

1) Membrane IS Process; hydrogen production by thermal water splitting using chemical reactions with iodine and sulfur, and membrane technologies

2) New steam electrolysis; hydrogen production by steam splitting with proton conducting oxide using electricity and heat

4

## Basic Technology for Hydrogen Station Utilizing Ammonia

Research Director

Yoshitsugu Kojima

Director, Institute for Advanced Materials Research, Hiroshima University

**Purpose** The purpose of this research is to develop ammonia decomposition and high purity H<sub>2</sub> supply system for hydrogen filling station.

**Research Outline** High purity H<sub>2</sub> supply system with low cost hydrogen transportation is a key issue to spread fuel cell vehicles (FCVs) and FC fork lifts. In this theme, we focused on ammonia as a hydrogen carrier because of high gravimetric and volumetric H<sub>2</sub> densities. We will develop a high purity H<sub>2</sub> supply system, which satisfies hydrogen fuel specifications for FCVs (ISO 14687-2) by NH<sub>3</sub> decomposition and separation technologies.

## 5 Ammonia Fuel Cell

**Research Director** Koichi Eguchi Professor, Graduate School of Engineering, Kyoto University

**Purpose** Development and demonstration of highly effective ammonia-fueled fuel cell systems

**Research Outline** ◆ Developing the direct ammonia-fueled SOFC systems and demonstrating 1 kW-scale power generation systems (main target)

◆ Investigating the combined systems as follows: (1) ammonia auto-thermal cracker and SOFC; (2) ammonia cracker and AEMFC (sub-target)

◆ Elucidating the compatibility of ammonia for the fuel cell systems and the degradation behavior of the ammonia-fueled fuel cells

## 7 Development of Hydrogen Supplying Technology Based on Organic Hydride

**Research Director** Hideshi Iki Principal Researcher, Central Technical Research Laboratory, JX Nippon Oil & Energy Corporation

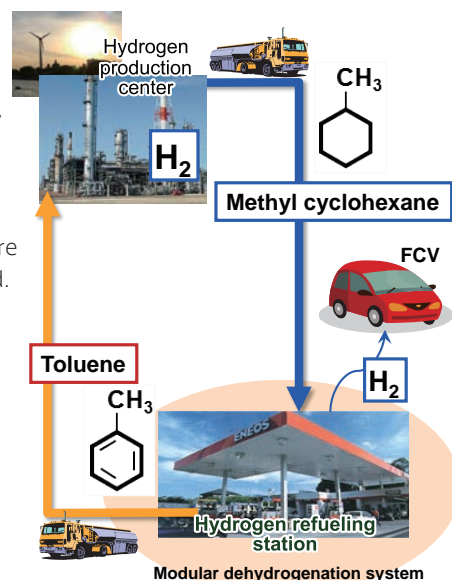

**Purpose** To develop a practical hydrogen refueling station and hydrogen supplying system based on organic hydride technology

**Research Outline** The followings are focused to develop a modular dehydrogenation system for hydrogen refueling stations:

- (1) Improving performance of the dehydrogenation catalyst
- (2) Improving efficiency & reducing the size of modular dehydrogenation system
- (3) Developing low-cost hydrogen purification system
- (4) Conducting safety assessments

Technologies for efficient organic hydride production are also being developed.

Further goal is to develop organic-hydride based hydrogen refueling stations and to promote widespread adoption of FCVs.

## 6 Ammonia Direct Combustion

**Research Director** Hideaki Kobayashi Professor, Institute of Fluid Science, Tohoku University

**Purpose** To develop ammonia direct combustion technology to utilize ammonia which is a hydrogen energy carrier as well as a CO<sub>2</sub>-free fuel

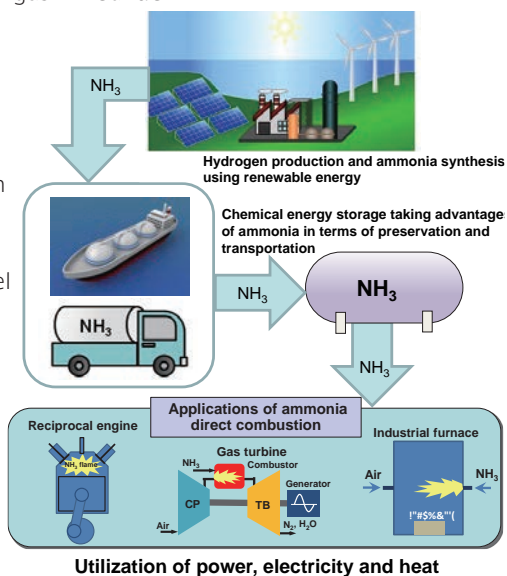

**Research Outline** Highly efficient utilization of ammonia combustion such as:

1) Gas turbine power generation using ammonia alone and ammonia/natural-gas mixed fuel

2) Application of ammonia reciprocal engines for transportations

3) Heat utilization in industrial furnaces using ammonia as a fuel

This project performs technology development and verification tests based on fundamental combustion research.

## 8 Development of Cargo Loading/unloading System for Liquid Hydrogen and the Relevant Rules for Operation

**Research Director** Tetsuya Senda Deputy Managing Director, Japan Ship Technology Research Association

**Purpose** This research aims to develop a loading and unloading system for liquid hydrogen and to establish relevant rules for operation of the system.

**Research Outline** In the research, swivel joints and emergency release systems for liquid hydrogen are to be developed, based on the existing LNG handling technology, and a loading and unloading system for liquid hydrogen integrating the developed equipment will be constructed. Operational safety measures are also specified and rules and standards will be established for the safe operation of the world-first system. The rules and standards will be internationalized, as necessary.

## Development of Hydrogen Engine Technology

Research  
Director

Masahide Kazari

Senior Manager, Technical Institute, Kawasaki Heavy Industries, Ltd.

**Purpose** We conduct the research for high efficiency and low-NOx-emission hydrogen engine realization.

**Research Outline:** We conduct the following research items for high efficiency and low-NOx-emission open-cycle hydrogen engine which shall be used for power generation or ship propulsion.

- ◆ Hydrogen combustion control technology
- ◆ Low-NOx technology
- ◆ High pressure hydrogen injector
- ◆ High pressure hydrogen pump

## Energy Carriers; their physico-chemical properties

	Pressurized Hydrogen (700MPa)	Liquid Hydrogen	Organic Hydride (Methyl Cyclohexane)	Ammonia
Molecular Weight	2.0	2.0	98.2	17.0
H <sub>2</sub> Content (wt%)	100	100	6.2	17.8
Volumetric H <sub>2</sub> Density (kg-H <sub>2</sub> /m <sup>3</sup> )	39.6	70.8	47.3	121
Boiling Point (°C)	—	-253	101	-33.4
H <sub>2</sub> Release Enthalpy Change ※ (kJ/mol-H <sub>2</sub> )	—	0.90	67.5	30.6
Other Properties	<ul style="list-style-type: none"><li>● Widely used</li></ul>	<ul style="list-style-type: none"><li>● High purity</li><li>● Low energy to pressurize</li></ul>	<ul style="list-style-type: none"><li>● Existing oil infrastructures can be utilized.</li></ul>	<ul style="list-style-type: none"><li>● High H<sub>2</sub> density</li><li>● Direct use for combustion</li></ul>

## Safety Assessment of Eenergy Carrier

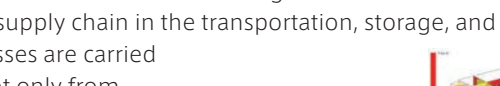

Research  
Director

Atsumi Miyake

Professor, Center for Creation of Symbiosis Society  
with Risk, Yokohama National University

**Purpose** The purpose is to build the vital society in which hydrogen energy can be operated safely and sustainably within an acceptable cost in suitable area.

**Research Outline** Risk assessment and management of the following three supply chain in the transportation, storage, and supply processes are carried out not only from the perspective of the operators and manufacturers, but also from the perspective of the citizens.

The diagram illustrates the three supply chain processes: Transportation, Storage, and Supply. The Transportation section features a truck icon and a 3D bar chart. The Storage section shows a 3D model of a storage tank with a pressure gauge, labeled "Analysis of hydrogen gas leakage behavior". The Supply section depicts a table with a hydrogen gas cylinder labeled  $H_2$ .

- 1) Compressed hydrogen supply chain
- 2) Liquid hydrogen supply chain
- 3) Organic hydride supply chain

I would like to demonstrate the hydrogen technologies developed for production, transportation, storage and utilization as tangible results at the Tokyo 2020 Olympic and Paralympic Games.

It is not only a demonstration as a showcase but also aims to be a big first step toward hydrogen society in Japan.

I have a confidence that hydrogen energy would contribute to the attractive urban development.

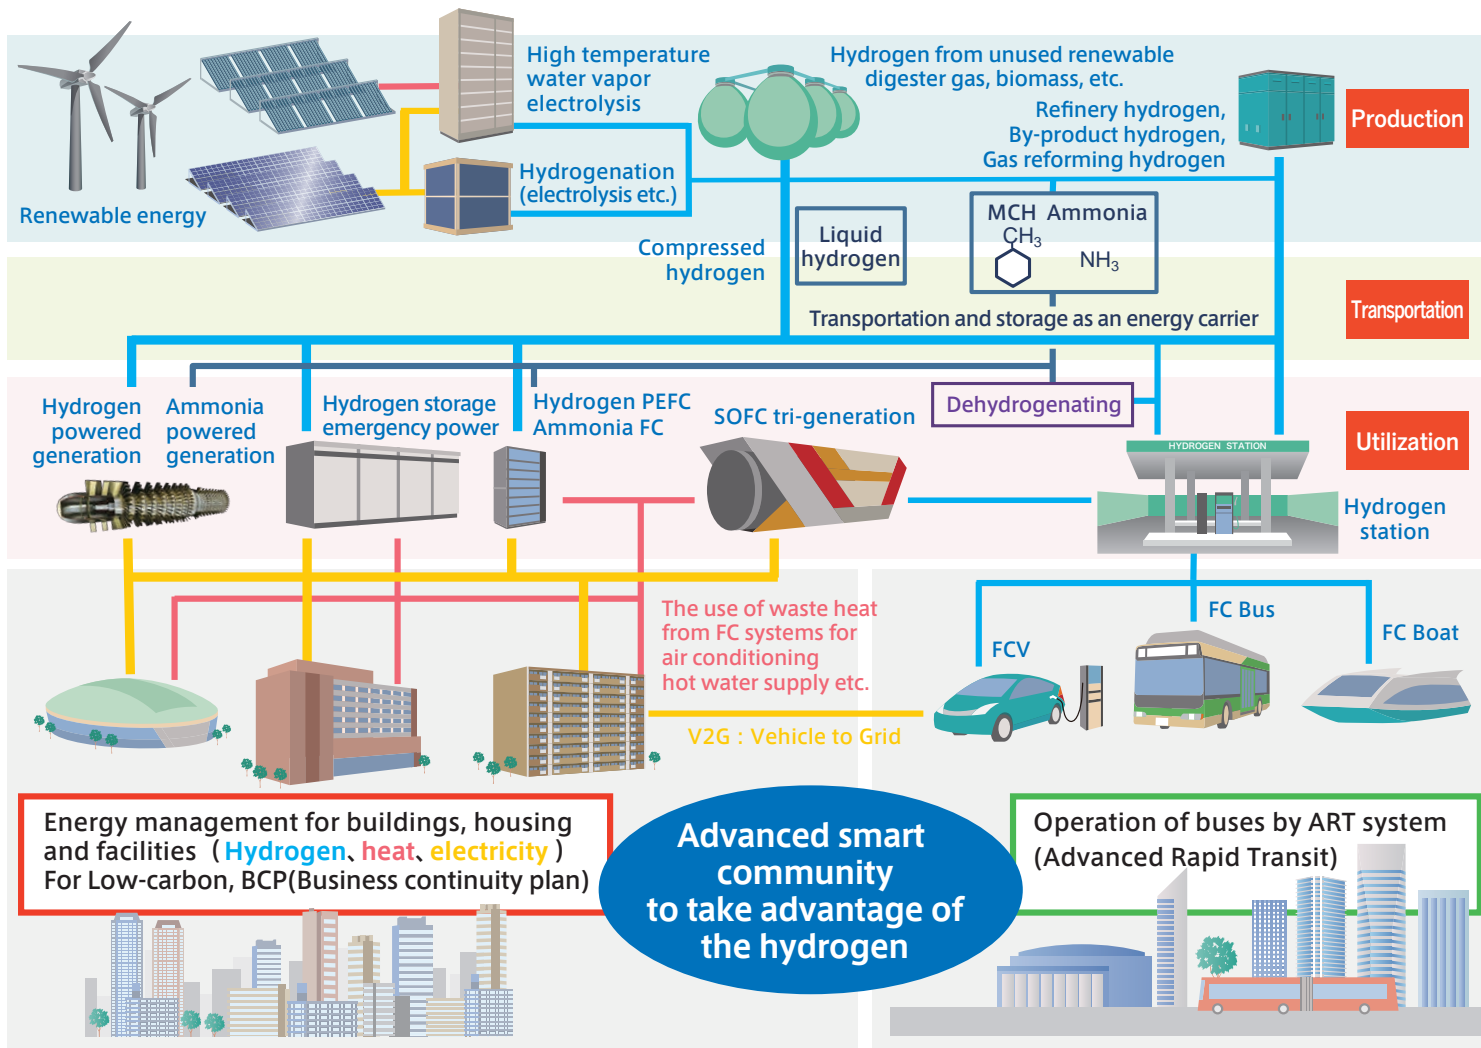

Program Director,  
SIP Energy Carriers

**Shigeru Muraki**

Executive Adviser, Tokyo Gas Co.,Ltd
